Table 1. Data sources

Dataset / endpoint	Cases	Controls	Exposure or clinical role
eQTLGen blood expression	—	—	Exposure: up to 31,684; predominantly European
BBJ GD (GCST90018627)	2,809	172,656	Discovery; East Asian
FinnGen GD (E4_GRAVES_STRICT)	3,962	496,386	Post hoc GD comparison; Finnish
UKB hyperthyroidism (GCST90038636)	3,731	480,867	Self-report; ancestry not established as exclusively European
FinnGen GO (GRAVES_OPHT)	858	499,490	Original ophthalmopathy comparison; Finnish
FinnGen GO strict (E4_GRAVES_OPHT_STRICT)	753	499,595	Post hoc definition sensitivity; Finnish

GD, Graves disease; GO, Graves ophthalmopathy; HT, hyperthyroidism/thyrotoxicosis. The three FinnGen R12 endpoints overlap and use population non-cases for their respective definitions. Strict is the source endpoint label, not proof of perfect specificity. The descriptive orbital series (four TED patients, one control) is separate from the genetic datasets.
